

Scroll 4

From sol 1358 to sol 1395 we see some miners booty that consists of some small stones close to a rock wall that is mined, evidence of carvings on the rock, and a scene of acute trauma.. The morphological characteristics of the dead matches that of an ogre like creature.

Sol 1398 has some very interesting sediments that display some advanced materials that were worn by a victim that dissociated and succumbed with the thickness of the layers visible.

At sol 1402 we see more bone that is mixed with the disturbed regolith,

At sol 1442 we see an alloy bust sticking out of the sand followed by some white ejects in the top fraction and some more white material in the substrate.

When we arrive at sol 1430 we see a rock that is smooth and with defined edges that is shaped like a key stone. There are others in identical fashion in the greater part of the study area.

The image at sol 1431 shows a close up of the medium that is smoothly worn with prehistoric use.

At sol 1433 we see what is suspected to be remains of a fallen warrior. At sol 1434 we see some more trauma with a disfigured face and a worm in the after-ground.

Each of the selected images is unique and interesting in its own way and this one is no different. Every unaltered Mars image holds some clue to catastrophe and this clue is in the form of a large megalithic rectangular slab. The sample is close to some darker areas that in the main basin of the channel and could be water ice rich. At sol 1434 we see some more trowel marks indicative of some type of craft. Further, we see a sample that carries with it a broken basin. At this site the wall is marked with a rectangular verse like script.

At sol 1436 6x6784 has signs of being altered by an unknown mechanical means with a large portion of the top fraction of the central deposition. Finger like grooves evenly spaced accompany the remaining letters. Sol 1436 also has some trauma in the immediate vicinity with some dissociated necrotic tissues with embedded items in the matrix.

And finally at sol station 1436 shows us signs of a catalyst being used with the presence of cured bubbles between the tiles in the grout mixture that was used.

Sol 1442 reveals some clear beads with some beads containing drilled holes.

Sol 1448 has eight entries; a carving or the remains of a fossilized small possibly juvenile bowhead-like whale, a suspected bust, areas that show signs of mining with embedded artifacts also pried away from the sediment. As we move along we see multiple cadavers, some with clear features such as the hand grasping for the gemstone inches away from a decomposed hand, the sailor, the profile of another. The sediment is undamaged and clear to see in the images. From above, sol station 1451 is close to some hills that could've once been an island with the hills stretching north for a couple of hundred kilometers..

Sol 1452 has some images of wildlife including a crocodile, a baboon and some metal, some suspected pelagic waterfowl and some fangs.

At sol 1453 there is a rock wall anomaly that looks like a long eared goblin with its tongue out.

Then at sol 1457 we see a smooth stone laying in the sand, overlooked by the looters.

Sol 1458 shows the distribution of smaller concretions in an area below the prehistoric tide line, a dry basin.

Sol 1458 is another fruitful day for the rover with many fascinating finds including a woman's face some roads and bubble like dwellings, a frog, some mixed forms in the art with various interesting media used such as paint and metal as art forms, a painted scene with a cottage on a hill, and a cup broken, dynamic energy amid the creative showcase. At sol station 1458 we see further evidence of a widespread spill of an ochre like dark fluid that formed a visible enamel like layer at sol 1436, and again, a more striking example is at sol 1600, The top fraction of red enamel is thicker here and

consistency is visible in the profile from the ejecta , sol 1766 _6X0890 has the best example of the fluid and how it rested before It hardened, a coagulated mass of blood and body fluid, (BBF)..

_SIF_1766_0832724296 is an example of the discharge coating the substrate.

At sol 1460: *Woman on a Table* is an engraving that shows a lighter side of existence that is lighter and more natural than what we have seen thus far. The cottage scene combined with this engraving show the lighter side of the red planet with mirth and merriment a part of every day life. The piece was crafted out of a sheet of soft alloy and embossed and painted. Sol 1460 is also home to the dust pan image that shows about one to two millimeters of sand collected.

Close at sol 1461, by we see some rectangular slabs and some remains that have been sectioned.

When we arrive at sol 1464 we see some fine sediments that have channels and ridges that meet at right angles. The substrate looks like a type of clay tile, overlapped and designed to channel rain water.

Sol 1466 is a wide angle capture of an area that includes some cave entrances and columns in the distance, faint yet visible. A cured pile of white calcite with small translucent mineral mixed in has hardened and is left unused as if the job was suddenly abandoned and left unfinished

Sol 1467 shows us an example of some packaged goods left on the go. The goods are wrapped in a canvas like cloth and bunched in the middle from where it was handled.

Sol 1469 has a scored line across the leading edge of a plaque from a defunct network.

Also at the same sol station there is an artifact with a gemstone in close proximity. As well as a three pointed star. At sol 1470 we find a cadaver that could be connected to unfinished project.

At sol 1471 we what could be the decayed first finger of a left hand. As we continue we see more interesting mineral formation at sol 1473, a victim of liquifaction necrosis at sol 1474, some scored lines in the substrate that look like they were drawn by hand at sol station 1476.

More fauna is found at sol 1476 to sol 1478 with a large prwn like sediment and a cranium that looks like a feline.

Sol 1478 is a study unto itself with a partly buried and deteriorated artifact followed by a deteriorated box with some small items still inside, In the last frame from 1478 5 different types of evidence can be found; animal, vegetable, mineralogical, artistic and geometric. This entry was intended to be a canary in a coal mine for alterations by the source and all 5 types were modified out of the image by the source.

Before the *TRIDENT* embossed from sol 1483 is a scarred area at sol 1482 with marks that are not made by the rover.

Before we get in to the maelstrom that is all of sol 1500, we need to pass through the area at sol 1486. This region is mostly characterized by the island and its proximity to the prehistoric foreshore. It is also a short distance to suspected water rich sediments immediately south. There are concretions on the steep sides of the hill plus there are stunning views across the topography. see

1485_FRF_0798776517. At this station we find a severed head and three noticeable artifacts. In the flats there is a cadaver with objects in the mix and there are large rectangular blocks that lay in the caked ground.

On the morning of sol 1500 Percival was met by over 250 over head objects in usual fashion.

We see fragments of figurines embedded in the dried ground and melted.

More disturbing than an environment that is extremely poisonous would be the giant *COCKROACHES* There are three abdomens of considerable length and girth over 5 meters each , apparently dispatched and stacked neatly alongside each other, The brave warriors who dispatched these and other *MONSTERS* could be your distant relatives. Sol station 1500 also has a good example of how the toxic atmosphere and constituents leach into sediment, From some broken shards of clay we can see

the extent that perchlorate bleaching has infiltrated the matrix of the rock with darker and presumably wetter rock in the center with the dry bleached rock around the outside.

The next slide is combined with a previous frame that shows the amount of sand that has collected in the tray. By simple arithmetic we can infer that after 7000 years the areas around the subject areas would be covered in at least one to two meters of sand which is not the case with some areas literally sand free. see 1511_6X0670 / *figure 771*.

A core was extracted from one of a series of plate like structures that may be part of a carapace or exoskeleton, possibly a section of tail bone. At timestamp 15:14:44 we see a wide angle shot of the area where the core was taken which shows much larger body armor plates at the BOTTOM of the frame, while at the TOP of the frame we see the tail section where the core was extracted. What lies in the center is a very large dinosaur. Having the core for laboratory analysis back on earth would tell for certain.

And finally we wind up sol 1500 in red planet fashion with a skull that has a shot gun shell sized hole in the lateral aspect.

Sol station 1500 is dominated by the tailbone core sample that leads to a much larger organism entombed in mud, perfectly preserved from archaic times, 329.3 million kilometers away.

On to sol 1503 where we see more packed goods, neatly organized. There is more evidence of trauma with some mutilated remains, and a fish.

At sol 1510 we have a multi media profile of a nude woman with a tall head dress.

A KEY is laying in the sand in the BOTTOM half of the frame on sol 1511,

At 1520 more trauma with a decapitated head.

Sol 1521 has a fascinating image of some very small hardware for some tiny metal alloy mechanism laying scattered around a small area.

Sol 1522 reveals some faces figures and grooves in the rock.

There are more figures here which were shaped by hand and include some interesting features including a small clay replica of a Gobleki Tepe styled monolith.

Sol 1523 has some inlaid features made of clay on the walls and an epic representation of a goblin that informs us where the stereotypical goblin face actually originates.

Sol 1534 is a reminder that some of the previous inhabitants were a marmoset like primate as seen here. How much of our DNA do we share with them?

Sol 1528 has a before and after laser marks were used to assay the rock.

Similar to the frame entitled '5 types of evidence' this is a reference frame.

As we wind up scroll 4 we are left with the thought of the BBF red enamel that is widely distributed across the study area.
