

scroll 1

sol 11 through 35 are mostly images of the sky above the rover after landing and the anomalous colours that steadily whiz overhead for the course of the study period. There is metallic triangular craft with two lights that is seen repeatedly in the following frames. A green spot of curious light is revealed in a couple of frames over a few sols that is suspect with the overhead activity, The images also provide a perspective of the canal with views of its steep sides that was carved deep into the estuary; a vast area laden with combined masses of all the debris that flooded down the many ravines to settle on the shores of the lake bed in the mud flows caused by the last major catastrophe.,

The overhead objects are many and seem to cascade in their numbers and diversity as the rover makes its way. The rover devotes noticeable time to watching the objects, whether they be natural or synthetic, as we see on sol 130.

At sol 138 we see some fine melted metal which recurs in various places across the study area. The metal is fine and usually is close to cadavers and when observed clearly small links of chain with stones and other metals mixed in can be seen. Whether the jewelry was destroyed by the cataclysm or was dusted by a team unbeknownst to us remains a question. More melted jewelry at sol 149 and on cue some morphosed cadavers affected from the catastrophe. A smiley face is present on sol 149 with the dead, possibly a way point from a previous expedition, a sign we see repeated in various places.

Further to sols 171 and 175, some fascinating features with details that resemble those of a surrogate mother with an infant. a carved forehead in the rock and a prominent head dress on a nurse or mother.

The area around sol 171 culminated in some intricate markings and a face at sol 175. From 198 to 267 we see a core bore hole that shows an air pocket halfway down the tube with a glassy crust ejecta. Next some more defunct networks more overhead anomaly and our first tampered with fossil. A large part of the target was removed and a darker red brown area remains in its place, less bleached by the searing volatiles in the atmosphere than a sample covered by rocks. We also see more evidence of direct heat supplication to small defined areas. The corner block at sol 236 shows this direct heat manipulation with a source that remains speculative.

At sol 246 we see the hair beard and torso from a man mostly dissociated proximal to these anomalous heat signatures in the sediment.

At sol 248 we can get a glimpse of the scale of the turbulent upheaval that occurred in this area followed by an engraving with some figures that I have summarized to generally be verse in long strings, cursive, at sol 265.

More core samples show a glassy fractured surface crust with a 4 to 5 cm layer of fine ash like material an air pocket and more compact fines below to the bottom of the bore hole. Similar to an avalanche, the top layer of fines shows us ash may have rained down in the area in successive waves,

At sol 280 we see some deep large cuts into an unknown substrate that has some stretch marks that could suggest it is a petrified and sectioned large organism, possibly aquatic. The sample lies below

the primordial lake high water line and is large enough to be a whale or other megafauna. There are two petrified creatures on a rock huddled together at sol 299 and down the way at 315 a large geometric block. There is a fish at sol 314 and at sol 325 engraved into the rock or a fossil.

To 345 we see a shaped object that looks like it has a specialized purpose and a fascinating spot where we see some cured cement that was pressed between two flat pieces of backing. A monstrous find as it confirms skilled techniques used at a mound site that is suspect of being a fort.

There is a lot to sol 397 but my biggest takeaway is the large cadaver of a headless creature with the head positioned above it. The head itself looks like a bear head but with no hair while the body a large human female like body. I would classify this as a di - morphic organism cadaver previously seen only in myth and legend.

When we get to sol 422 we can see how the two mound sites compare. Arguably the identical layers are not easily repealed in nature.

Sol 425 is a dramatic image of a melted corner block, followed by projectile point at sol 428 and some archaic tile at sol 441. The tile is white and would reflect the ambient light well on the dark red planet. As if on cue with overhead aircraft still abundant, a pile of speckled grout or adhesive mixture lays unused. More and more green fragments become evident laying on the top fraction. A massive area a few km just south has a mountain of green glass visible from HIRISE, This combined with the shattered image of the Lizard King implies a vast palace of emerald was destroyed, probably the lair of the aforementioned resident.

At 452 the rovers grinding wheel reveals some thin metal on the surface that resembles lightly tarnished copper similar in thickness to foil. If this isn't curious enough, two sols alet we find a book with an embossed cover with images of Ets on it,; the pages are visible under the cover and mixed in the sand.

The scoured hillside at sol with slopes of green sand like snow that fell close to the ruins, a painted area with a spot of green like a paint can exploded, some curious lines made by mechanical means and at sol 482 yet another large creature to take note of.

The cores show the green in the lower half of the profile but then after show green thorough the core and as suddenly as it arrived, no green in the following profile. Lowell may have thought this was a moss.

Two sets of hoofs from two or more hoofed creatures, combined with the other signs of megafauna.

On the very next sol 523 we see a morphosed cadaver with a garment that is easy to see, some brick courses at sol 532 and a small neatly folded petrified piece of fabric sitting on a rock. Immediately beside this is a massive fallen rock sculpture of a cobra snake. Truly amazing to see this megalith and preserved in the sand. .

On 534 there is more evidence of a highly advanced approach to collecting artifacts and leaving a trail. A spray enamel was used to dust the object and was subsequently taken leaving only the anchor points in the cured residue. A clear sample and most notable.

At 558 an object that appears to be smoothed by repeated handling. Broken tile and the backing under it at sol 564, at sol 566 evidence of a catalyst in the cured cracks of the tile, straight ridges in the rock, imploded organisms, seal like creatures near the ancient fore shore at sol 571 and a trifecta of evidence at this same spot: past life on Mars encased in rock.

The image shows a deceased lion with a noticeable missing cheek exposing its teeth.

sol 577 is a good example of the cross section of the tile and backing with a bore hole to show the profile and could be an interior tile from a building with walls that collapsed and long since decayed away.

sol 607 is an object that appears to be a hand maul, while the frame at 625 could be a spot along the high water mark as a flat area. The slab is almost perfectly rectangular with straight and well defined edges, Some ridges form a set of tiny stairs that lead from the top to the waterline made specifically for little feet. As we will see in some of the images to follow, some of the craftsman are quite small compared to us as we will see in the complex detail in a carving the size of a dime .

The last few sols of the first scroll are close to some depositions that look distinctly anthropocentric in nature with form and function on display for all to see.
